\*\* SLIT Allergy Drops use the same FDA approved medication which is currently used for Allergy Shots.

Presently, this medication is not specifically approved for use under the tongue and therefore considered an "off-label" use of the FDA-Approved allergen extract.

## What is Sublingual Immunotherapy (SLIT)?

Sublingual immunotherapy (SLIT) is similar to subcutaneous immunotherapy (SCIT), also known as allergy shots. Like allergy shots, SLIT uses small doses of allergens to build the body's resistance and decrease the allergic individual's resistance over time. Unlike allergy shots, when using SLIT these individuals are given a solution of allergen extracts called allergy drops to place under the tongue. SLIT has been clinically proven and routinely used in Europe for the past century. Though a full treatment can last years, many report improved symptoms after just a few months.

## How Does SLIT Help Fight Allergies?

Our immune system keeps us alive by attacking dangerous germs. An allergy is when our immune system attacks a harmless substance, like pollen (an allergen), against something it should ignore. This attack releases chemicals that cause allergy symptoms. Medication, like antihistamines, mask the symptoms but do not get at the underlying problem. SLIT aims to treat the underlying problem by training the immune system to ignore the harmless allergen.

## Why Use SLIT?

To train your immune system to ignore the allergen, you can do SLIT or Allergy Shots (SCIT).

The problem with allergy shots is that they hurt have side effects and require weekly visits to the doctor's office.

With SLIT you put drops under your tongue at home. Convenient, customizable, safe and no painful shots.

**Convenience** - because allergy drops are less intrusive than allergy shots they are much more tolerable. While allergy shots require weekly office visits, allergy drops are done in the comfort of your home. Because consistency is essential, the convenience SLIT offers can make a big difference in allergy treatment.

**Customization** - SLIT is customizable to each patient's needs. Allergy shots start every patient on the same dose but SLIT can start at a weaker strength with less allergenic substances which increases the patient's safety.

**Safety** - SLIT allows for fine tuning that allergy shots does not. This and the regular monitoring by your physician enables sensitive patents and those with multiple allergies the chance to be treated.
